### Conventions used in this document

- · Lists:
  - Numbered lists are used to show the steps involved in completing a task when the order is important.
  - Bulleted lists are used when the order is unimportant or to show alternatives.
- Bold is used for menu items and for labels.

For example:

- · Record a valid email address in 'From' email address.
- · Select Save from the File menu.
- Italic is used for emphasis:

For example:

- · Copy the file before starting the installation.
- Do not remove the files before you have backed them up.
- **Bold and italic** hyperlinks are used to identify the titles of other documents.

For example: "See the *Release Notes* for further information."

Unless otherwise explicitly stated, all referenced documentation is available on the product installation media.

- A fixed width font is used where the identification of spaces is important, including filenames, example SQL queries and any entries made directly into configuration files or the database.
- Notes are used to provide further information, including any prerequisites or configuration additional to the standard specifications.

For example:

Note: This issue only occurs if updating from a previous version.

 Warnings are used to indicate where failure to follow a particular instruction may result in either loss of data or the need to manually configure elements of the system.

For example:

Warning: You must take a backup of your database before making any changes to it.

## 1 Introduction

**Note:** MyID MFA and MyID PSM were previously known as Authlogics products. Authlogics is now an Intercede Group company and the products have been rebranded accordingly. The term 'Authlogics' may still appear in certain areas of the product.

Microsoft supports federated access to Microsoft 365 resources through SAML 2.0 and WS-Fed federation protocols. This document details the steps required to configure MyID MFA 5.0 federation with Microsoft 365 using SAML 2.0.

MyID MFA natively supports multi-domain SAML 2.0, and does not require ADFS for integration.

Federation with Microsoft 365 Page 5 of 35

Page 6 of 35

# 2 Prerequisites

This document does not detail how to set up a hybrid environment with Microsoft 365 or Entra ID; this must already be in place. Specifically, you must have already set up the following:

- A Microsoft 365 tenant in "Managed" state (that is, not currently federated).
- The Microsoft.Graph PowerShell module.
  - See section 2.1, PowerShell.
- Directory synchronization with Microsoft Entra Connect (Azure ID Connect), or other management method for the Entra Immutable ID.

For details of setting the Entra Immutable ID without a directory, see section 6, *Federation without directory synchronization*.

- · Entra ID admin logon.
- · A deployed MyID MFA Server, with:
  - MFA users configured and tested (for example, using the Self Service Portal).
  - · Public DNS entry for the IdP.
  - Public SSL certificate configured on the MFA server matching the DNS entry.
     For more information, see section 2.6, DNS and SSL.
  - · Inbound SSL access to the MyID MFA server from the Internet.

You must also carry out the following:

- Verify your current federation configuration.
  - See section 2.2, Verify the current federation configuration.
- You may want to remove an existing federation configuration.
  - See section 2.3, Removing an existing federation configuration.
- Check that you are not trying to federate the Entra default domain.
  - See section 2.4, Verify the Entra default domain.

#### You may want to:

• Switch from WS-Fed to SAML2 federation protocols.

See section 2.5, Switching from WS-Fed to SAML2

Federation with Microsoft 365

#### 2.1 PowerShell

You require the Microsoft Graph PowerShell module for steps in this document.

To check if you already have this module installed, run the following command at an administrator PowerShell prompt.

```
PS C:\> Get-Module -Name Microsoft.Graph -ListAvailable
```

If you do not have the module installed, to install the module, run the following commands at an administrator PowerShell prompt.

```
PS C:\> Install-Module Microsoft.Graph -Scope AllUsers -Repository PSGallery -Force
```

```
PS C:\> Import-Module Microsoft.Graph.Identity.DirectoryManagement
```

To execute a Microsoft Graph PowerShell command, you must authenticate with Entra. You are recommended to use an Entra ID administrator account, not a hybrid account, while configuring federation settings.

#### 1. Run the following command:

```
PS C:\> Connect-MgGraph -Scopes
'User.ReadWrite.All,Group.ReadWrite.All,Directory.ReadWrite.All,Directory.AccessAsUSer.All'
```

You are prompted to authenticate using the appropriate method configured on the Entra account:

2. Provide your authentication details and sign in.

3. Select the Consent on behalf of your organization option:

Federation with Microsoft 365 Page 8 of 35

## 2.2 Verify the current federation configuration

Ensure that the Office tenant is not already set up to use another federation server. Connect to MS Online and check the domain status is <code>Verified</code> and <code>Managed</code> by running the following commands:

## 2.3 Removing an existing federation configuration

To remove an existing federation configuration and set the authentication in Entra back to Managed, run the following command:

```
PS C:\> Update-MgDomain -DomainId 'federationdemo.com' -AuthenticationType 'Managed'
```

**Note:** This may take up to two hours to take effect fully in Entra ID, even if the PowerShell commands show that the configuration has been changed.

## 2.4 Verify the Entra default domain

Microsoft Entra does not allow the default domain to be federated. To verify that the domain you want to federate with is *not* the default domain, run the following command:

```
PS C:\> Get-MgDomain | select Id, IsDefault

Id IsDefault

federationdemo.onmicrosoft.com True
federationdemo.com False
federationdemo.mail.onmicrosoft.com False
```

If the domain with which you want to federate has the IsDefault value of True, you can set the xxx.onmicrosoft.com (or another) domain as the default by running the following command:

```
PS C:\> Update-MgDomain -DomainId 'federationdemo.onmicrosoft.com' - IsDefault
```

## 2.5 Switching from WS-Fed to SAML2

Microsoft 365 supports both SAML2 and WS-Fed federation protocols. To change from WS-Fed to SAML2 you must first disable federation for the domain by making it "Managed" (see section 2.3, Removing an existing federation configuration) and then create a new SAML2 configuration following the instructions in this guide.

Federation with Microsoft 365 Page 9 of 35

### 2.6 DNS and SSL

The MyID MFA server requires a publicly trusted SSL certificate. The DNS name in the SSL certificate must match the MyID MFA-configured IdP Host and Domain configuration; for example:

idp.federationdemo.com

The DNS A or CNAME record must resolve to the MyID MFA server through any firewalls or load balancers. Firewalls must allow TCP port 443 from the Internet to the MyID MFA server.

Federation with Microsoft 365 Page 10 of 35

# 3 Adding the Microsoft 365 application

Open the MyID MMC to add an Application.

1. Start the Add Application Wizard.

2. Click Next.

3. Select Microsoft 365 from the list and enter a custom name if required.

Federation with Microsoft 365 Page 11 of 35

#### 4. Click Next.

- 5. Select the required logon technology and authentication options.
- 6. Click Next.

- 7. Confirm the Host configuration information.
- 8. Click Copy Base64 to copy the Base64 signing certificate information to the clipboard.

Federation with Microsoft 365 Page 12 of 35

### 9. Click Next.

### 10. Click Finish.

The MyID side of the Microsoft 365 configuration is now complete.

# 4 Configuring federation

You perform the Microsoft 365 side of the configuration using PowerShell commands. To simplify the process, configure a custom PowerShell script with the settings for your environment. When you run the PowerShell script, it configures Microsoft 365 to use the MyID MFA Server for federated authentication.

When configuring single domain federation:

- Enable single domain federation using PowerShell.
   See section 4.1, Enable single domain federation using PowerShell.
- Verify the configuration.
   See section 4.2, Verify the configuration.
- Test the federation setup.
   See section 4.3, Test the federation setup.

## 4.1 Enable single domain federation using PowerShell

Configure the yellow highlighted variables in the following sample script with the values of your domain and MyID MFA server.

- \$domain The DNS domain to federate, which must already be set up in Microsoft 365.
- \$display The friendly name shown to users when signing in to Microsoft 365. You are recommended to use something that is familiar, like your company name.
- \$issuerUri The Issuer URI from the SAML 2.0 tab in the Applications Properties
  dialog. The default value will be a derivative of your IdP host and domain name; for
  example:

'urn:uri:ipdfederationdemocom'

- \$signinUrl The SAML 2.0 IdP sign-on page URL. The path is fixed; however, the DNS name must match the public DNS name of the IdP.
- \$signoutUrl The SAML 2.0 IdP logout page URL. The path is fixed; however, the DNS name must match the public DNS name of the IdP.
- \$certificate The Base64 representation of the IdP signing certificate. You can
  obtain this value by clicking the copy icon on the Signing Certificates tab of the
  Applications Properties dialog or by clicking the Copy Base64 link at the end of the Add
  Application Wizard.
- 1. Copy the text from the sample below to a new plain text document and save it as a .ps1 file.
- Configure the yellow highlighted variables in the following sample script with the values of your domain and MyID MFA server.
- 3. Run the script at a PowerShell command prompt to apply the configuration.

Federation with Microsoft 365 Page 14 of 35

Federation with Microsoft 365 Page 17 of 35

# 4.3 Test the federation setup

1. To test the federation setup, go to the following URL and sign in:

### portal.office.com

2. Enter your Account name.

3. Wait while Microsoft redirects you to the MyID MFA logon page.

4. Confirm your account name.

Federation with Microsoft 365 Page 19 of 35

5. Enter your MFA details based on the configuration.

This example uses Passwordless & Deviceless Grid authentication.

Once validated, you are redirected back to Microsoft 365 and are signed in.

# 5 Multi-domain configuration

Microsoft Entra (Azure AD) requires a unique SAML IssuerUri for each DNS domain across all Azure tenants. The IssuerUri is a federation server value, and not a Microsoft 365 application specific value.

Note: If you have only one DNS domain to federate, this configuration is not required.

When setting up multi-domain federation, you must:

- Add additional domain names.
   section 5.1, Adding additional domain names
- Make multiple unique IssuerUris.
   See section 5.2, IssuerUri format impact.
- Enable multi-domain federation.
   See section 5.3, Enable multi-domain federation using PowerShell.

You may also want to:

Change from a single to multi-domain configuration.
 See section 5.4, Changing from a single to multi-domain configuration.

Federation with Microsoft 365 Page 21 of 35

## 5.1 Adding additional domain names

To support multiple domains, the actual domain names to be federated must be specified. You must add, remove, and view the names through the MMC or through the Rest API.

To specify the names through the MMC, in the **Multiple DNS Domains** section, set the **Enabled** option, then list the domains in the text box.

To specify the names through the API, use the following calls:

- AddIdpDnsName
- RemoveIdpDnsName
- GetIdpDnsNames

When calling  ${\tt AddIdpDnsName}$  or  ${\tt RemoveIdpDnsName}$ , you must:

• Specify the full DNS name of the domain; for example:

entrademo.com

• Run iisreset for the IdP to read the new configuration.

Note: These API calls require administrator rights.

Federation with Microsoft 365 Page 22 of 35

## 5.2 IssuerUri format impact

The default IssuerUri format for the MyID Authentication Server is:

urn:uri:{idp-fqdn-without-dots}

#### For example:

urn:uri:idpfederationdemocom

This ensures that each MyID MFA deployment has a unique IssuerUri for each MyID MFA customer. However, when multiple domains are required to be federated, multiple unique IssuerUri values are also required.

The Authentication Server automatically generates unique IssuerUri names using the configured IssuerUri name appended with the specified DNS domains you want to federate. The resulting format is as follows:

```
urn:uri:{idp-fqdn-without-dots}:{federated-domain-without-dots}
```

For example, if acme.com and contoso.com are federated domains with an Authentication Server having a configured IssuerUri of urn:uri:idpfederationdemocom, the resulting domain specific URIs are:

- urn:uri:idpfederationdemocom:acmecom
- urn:uri:idpfederationdemocom:contosocom

You must use these domain specific URIs during each Microsoft 365 configuration.

## 5.3 Enable multi-domain federation using PowerShell

Configure the yellow highlighted variables in the following sample script with the values of your domain and MyID MFA server.

- \$domain The DNS domain to federate, which must already be set up in Microsoft 365.
- \$display The friendly name shown to users when signing in to Microsoft 365. You are recommended to use something that is familiar, like your company name.
- \$issuerUri The **Issuer URI** from the **SAML 2.0** tab in the Applications Properties dialog. The default value will be a derivative of your IdP host and domain name. This is then appended with a colon and the federated domain name without dots; for example:

'urn:uri:ipdfederationdemocom:customdomaincom'

- \$signinUrl The SAML 2.0 IdP sign-on page URL. The path is fixed; however, the DNS name must match the public DNS name of the IdP.
- \$signoutUrl The SAML 2.0 IdP logout page URL. The path is fixed; however, the DNS name must match the public DNS name of the IdP.
- \$certificate The Base64 representation of the IdP signing certificate. You can
  obtain this value by clicking the copy icon on the Signing Certificates tab of the
  Applications Properties dialog or by clicking the Copy Base64 link at the end of the Add
  Application Wizard.
- 1. Copy the text from the sample below to a new plain text document and save it as a .ps1 file.
- 2. Configure the yellow highlighted variables in the following sample script with the values of your domain and MyID MFA server
- 3. Add the domain name to the MFA Server using the AddIdpDnsName API call.
- 4. Run the script at a PowerShell command prompt to apply the configuration.

Federation with Microsoft 365 Page 24 of 35

# 5.4 Changing from a single to multi-domain configuration

To change from a single domain to a multi-domain configuration:

- Remove the existing federated connection to Entra.
   See section 2.3, Removing an existing federation configuration.
- 2. Add the federated domain names to the MFA server. See section 5.1, Adding additional domain names.
- Add the new multi-domain federation configuration.
   See section 5.3, Enable multi-domain federation using PowerShell.

# 6 Federation without directory synchronization

For federation to work with Entra ID (Microsoft 365 / Azure AD) there must be a specific mapping between the MFA user account and the Entra ID user account.

In a typical Microsoft hybrid configuration, the Microsoft Entra Connect (Azure ID Connect) synchronizes the required fields to link the accounts. If Entra Connect is not in place (for example, in a Managed Service Provider environment) you must map the account attributes manually.

The following user specific attributes must match in both MFA and Entra ID:

NameID

The Entra user's Immutable ID (OnPremisesImmutableId).

If Microsoft Entra Connect is deployed, the Entra Immutable ID property contains the Base64 equivalent value of the Active Directory objectGUID property.

**Important:** Once you have set the Immutable ID value, you cannot change it; that is the defining feature of *immutable* IDs.

If Microsoft Entra Connect has *not* been deployed, the Entra Immutable ID property is empty and *must* be populated before federation will work for the user.

• IDPEmail

The User Principal Name (UPN) value in Entra; not the email address field (despite the attribute name being IDPEmail). The UPN is typically the same as the email address, although this may vary.

For further information, see:

learn.microsoft.com/en-us/entra/identity/hybrid/connect/how-to-connect-fed-saml-idp

## 6.1 Checking the Entra ID values for a user

You can check the Entra ID values for a user with PowerShell or using the Microsoft Entra admin center.

### 6.1.1 Using PowerShell

To view the values stored in Entra for a user, run the following PowerShell script, replacing the highlighted values for \$tenantId and \$accountUpn:

```
$tenantId = 'federationdemo.com'
$accountUpn = 'johnd@federationdemo.com'
Connect-MgGraph -TenantId $tenantId -Scopes 'User.ReadWrite.All' -NoWelcome
Get-MgUser -UserId $accountUpn -Property UserPrincipalName,
OnPremisesImmutableId | fl UserPrincipalName, OnPremisesImmutableId
```

#### The PowerShell script outputs the user details as follows:

```
UserPrincipalName : johnd@federationdemo.com
OnPremisesImmutableId : X1vAuhkd70KAAfnfxA6DyA==
```

### 6.1.2 Using the Microsoft Entra admin center

To view the values stored in Entra for a user using a browser:

- Open the Entra ID Users page:
   entra.microsoft.com/#blade/Microsoft\_AAD\_ UsersAndTenants/UserManagementMenuBlade/menuId/
- 2. Select the user.
- 3. Select the **Properties** tab near the top.
- 4. Locate the User principal name value.
- 5. Locate the **On-premises immutable ID** value.

## 6.2 Creating an Immutable ID value in Entra

If you have not deployed Microsoft Entra Connect, the user account does not have an Immutable ID value. If your intention is to configure a hybrid deployment, you must configure Microsoft Entra Connect to set the Immutable ID value. If you do *not* intend to configure a hybrid deployment (that is, you want to remain cloud-only) you must generate and configure an Immutable ID value in both MFA and Entra.

To generate a new Immutable ID value and view the results in Entra for a user, run the following PowerShell script, replacing the highlighted values for <code>\$tenantId</code> and

```
$accountUpn:
$tenantId = 'federationdemo.com'
$accountUpn = 'johnd@federationdemo.com'
$newGuid = [system.guid]::newguid()
$base64 = [system.convert]::ToBase64String(([GUID]$newGuid).ToByteArray())
Connect-MgGraph -TenantId $tenantId -Scopes 'User.ReadWrite.All' -NoWelcome
Update-MgUser -UserId $accountUpn -OnPremisesImmutableId $base64
Get-MgUser -UserId $accountUpn -Property UserPrincipalName,
OnPremisesImmutableId | fl UserPrincipalName, OnPremisesImmutableId
```

**Important:** Once you have set the Immutable ID value, you cannot change it; that is the defining feature of *immutable* IDs.

Federation with Microsoft 365 Page 29 of 35

## 6.3 Adding the Immutable ID to the MFA user account

Use the MFA Server Rest API to get and set the user account EntraID property.

You can specify the value as Base64 or a GUID formats when setting it. When reading the value, the Base64 version is always returned to allow you to match the value displayed in Entra.

Note: This API call requires administrator rights.

### 6.3.1 Active Directory user

An MFA user created on an Active Directory user account automatically has an EntraID property, as this is derived from the <code>objectGUID</code> property and cannot be changed. You can only get the value using the MFA server Rest API; you cannot set it.

If you are using an Active Directory user account that is not synchronized with Entra, extract the value from the MFA server and configure it on the Entra user account. Do *not* generate a random GUID (as above) as the account will never match.

#### 6.3.2 External / Realm user

An MFA user created on an External / Realm based user account has an empty <code>Entraid</code> property by default. As it is not an actual Active Directory user account, the <code>objectGUID</code> value is not used. Instead, you can get and set the user's <code>Entraid</code> property using the MFA server Rest API, and you can change it if required.

# 7 Troubleshooting

This section contains troubleshooting information for situations that may occur when working with federated access.

#### These situations are:

- The browser looping between Microsoft 365 and the IdP through redirects. See section 7.1, Browser redirect loop between Microsoft 365 and the IdP.
- Attempting to use a non-unique IssuerUri value.
   See section 7.2, Unique IssuerUri values.
- A signing certificate error.
   See section 7.3, Signing certificate error.

Federation with Microsoft 365 Page 31 of 35

### 7.1 Browser redirect loop between Microsoft 365 and the IdP

Microsoft Entra (Azure AD) and 365 are regularly adding features, changing settings, and updating security defaults. This may cause problems with federated connections from time to time.

The security defaults of Entra may interfere with third-party federated access, as Entra tries to apply Entra MFA security policies which are not being used. This may result in the inability to access the 365 website after a successful federated logon, including a browser redirect loop.

To resolve this problem using the Microsoft Entra UI:

- 1. Go to the following URL:

  entra.microsoft.com/#view/Microsoft\_AAD\_

  IAM/TenantOverview.ReactView?Microsoft\_AAD\_IAM\_legacyAADRedirect=true
- 2. Select the Properties tab.
- 3. Scroll down to the bottom and click Manage security defaults.
- 4. Select Disabled (not recommended).
- 5. Save the settings.

To resolve this problem using PowerShell, run the following script:

```
# Authenticate scope to change Security Defaults
Connect-MgGraph -scope 'Policy.ReadWrite.SecurityDefaults,Policy.Read.All'

# Show Setting
Get-MgPolicyIdentitySecurityDefaultEnforcementPolicy | Select DisplayName, IsEnabled

# Enable Security Defaults
Update-MgPolicyIdentitySecurityDefaultEnforcementPolicy -IsEnabled
```

Federation with Microsoft 365 Page 32 of 35

# Disable Security Defaults
Update-MgPolicyIdentitySecurityDefaultEnforcementPolicy -BodyParameter @{isEnabled =
\$false}

# 7.2 Unique IssuerUri values

Microsoft requires a unique IssuerUri for each DNS domain registered in Entra; this applies across all tenants, not just your own tenant. If you attempt to federate a domain in Entra using an IssuerUri that has previously been used, may see a PowerShell error similar to:

Unable to complete this action. Try again later.

If you wait and try again as stated, this has no effect. You must make sure your IssuerUri is unique, or make use of the MyID multi-domain configuration; see section 5, *Multi-domain configuration*.

Federation with Microsoft 365 Page 33 of 35

# 7.3 Signing certificate error

If, after the MFA login as the browser is redirected back to Microsoft 365, an error occurs similar to the following:

Sorry, that didn't work.
Please go back to Office.com and try again.
Thanks.

This error can be caused by the following:

Federation with Microsoft 365 Page 34 of 35

The IdP signing certificate is incorrectly configured.

To resolve this issue:

1. On the Applications Properties dialog, select the **Signing Certificates** tab, then click the copy icon to get the Base64 value of the IdP signing certificate.

2. Run the following PowerShell command:

PS C:\> Get-MgDomainFederationConfiguration -DomainId 'federationdemo.com' | select SigningCertificate

#### The PowerShell returns the signing certificate:

SigningCertificate

MIIDGDCCAgCgAwIBAgIQFaTIA1mLiLtJ+wsZt9M2ejANBgkqhkiG9w0BAQsFADAfMR0wGwYDVQQDDBQqLmZlZGVyYXRpb25kZW1vLmNvbTAeFw0yNDAzMDUxNDIONTZaFw0zNDAzMDUxNDMONTVaMB8xHTAbBgNVBAMMFCouZmVkZXJhdGlvbmRlbW8uY29tMIIBIjANB...

Check that the result returned from the PowerShell script is the same as the Base64 you obtained from the Applications Properties dialog.

If the results are not the same, this means that Entra is configured to use a different certificate to the IdP. Ensure the IdP is using the correct signing certificate (not to be confused with the SSL certificate), then configure Entra to use the correct Base64 value.

· The MFA authentication server's time or timezone is incorrect.

If the time or timezone on the authentication server is incorrect, the signing of the SAML information is carried out at an invalid time.

To resolve this issue, set the time and timezone to the correct settings.
