MyiD CMS

What's New in MyID CMS v12.15

FIDO for the Enterprise – Enhanced Collection

In this release we have simplified the Passkey registration process on Windows and provided a single user experience for the collection of both Passkeys and certificates. This process can also include registering Passkeys for Entra ID and validating Enterprise Attestation requirements on compatible devices.

Set Minimum PIN Length and Change PIN at First Use are now available ensuring PIN policies for an organisation are maintained.

The benefits of these changes are:

▸ Reduced need for end user support and trouble shooting
▸ Trust in the device used for Passkey Registration
▸ Demonstrate auditable compliance with security policies

Report Designer

MyID Report Designer enables creation and management of customized reports for your CMS installation. The web-based user interface provides a simple way to use data from a wide range of CMS data objects and attributes; join, merge and aggregate information to meet your reporting needs and provide static or user selected filters to refine the results.

The feature also includes revision management, allowing drafts to be created and approved before being published to end users.

To help deployment, reports can be exported and imported between CMS installations making it easier to work on drafts in pre-production then roll them out to your primary installations for production use.

Third Party Key Recovery

We have updated our Key Recovery processes to allow Third Parties (For example Supervisors, Corporate Officers, Auditors, Law Enforcement) to receive recovered certificates and keys. As part of a managed process, a different person must Request and Approve these requests to ensure 2-person control. Recovered keys can be collected on to

What's New in MyID CMS v12.15

smartcards and security keys, or where certificate policy permits as software files. Secrets that protect access to the keys, for example a device pin or password to a certificate file can be notified to the third party without being accessible to anyone with access to the CMS. Confidentiality of the process is maintained by restricting access to activity logs.

Operator Client and MyID Core API

The next phase in the modernisation of web user interfaces and MyID Core API for systems integration have been rolled out.

This release has focused on Group Management features, Logon Messages, Notifications Management and System Events updates.

We have also rolled out several new UX improvements, providing new features with a search bar for reports and a refresh button for 'View' pages.

The new objects are also available in the new Report Designer feature to enable inclusion in your own custom reports.

Deployments

In this release we have added the ability to switch your MyID installation into system maintenance mode, so that you can take the installation offline in a controlled way. This helps when deploying updates to CMS, or if another part of the identity and access management infrastructure integrated with MyID needs to be taken offline, avoiding end user problems. MyID clients have been updated to handle these cases as well, providing descriptive messages when the server is in maintenance mode.

Integration Updates

Certificate Authorities

- Digicert One Update (Public S/MIME handling)
- Primekey EJBCA Update

Smart Card Printers

- HID/Fargo SDK 3.1.0
- Fargo HDP 6600 (Latest firmware)
- IDP-81
